AGRICULTURE & FOOD SECURITY

NIGER FACTSHEET

Niger regularly experiences low and variable rainfalls, land degradation, deforestation, and desertification. Most Nigeriens depend on agriculture for their livelihoods, and frequent floods, extended droughts, and increasingly unpredictable rainfall patterns in the region often lead to food, animal feed, and fodder shortages. The resulting chronic food insecurity and a high prevalence of infectious diseases have led Niger to record some of the highest malnutrition and mortality rates in the world.

More than 47 percent of children under five years of age suffer from chronic malnutrition. An estimated 4.4 million Nigeriens are food-insecure and approximately 1.4 million children under five years of age suffer from acute malnutrition, and millions more experience periodic food shortages during the lean season.

OUR WORK

USAID agriculture and food security programs in Niger are designed to spur more opportunities for employment, contribute to national food security and stability, and help people rise out of poverty and effectively manage recurring shocks and stresses.

AGRICULTURE

USAID is supporting Niger's agriculture sector with a focus on the most vulnerable. USAID is working on several fronts: increased access to finance; more economic opportunities; improved natural resources; increased farm production; and better access to nutritious foods.

In addition, USAID is working with farmer groups to improve the competitiveness and inclusiveness of three value chains: cowpeas (black-eyed peas), small ruminants (goats and sheep), and poultry.

FOOD SECURITY

USAID is reducing food insecurity in Niger through a combination of emergency humanitarian and development assistance. USAID's Bureau of Humanitarian Affairs, in collaboration with other development activities under the Resilience in the Sahel Enhanced (RISE) II project, form the core of the food security program in Niger.

USAID designed these projects in response to a pattern of repeated crises. These projects have been implemented over several decades, as local populations do not have the means to prevent, withstand, and recover from risks that are commonly referred to as shocks. Shock types vary, but they typically include natural catastrophes such as floods, droughts, and storms, or man-made crises such as political unrest or violent extremism. One's ability to prevent, withstand, and rebound from shocks is called resilience.

The RISE II project addresses the causes of people's and communities' chronic vulnerability to shocks by increasing their resilience. This can be done by helping them develop more and better ways to make a living and improve their overall health and nutrition.

OUR GOALS

- Reduced malnutrition in target areas
- Reduced vulnerability and need for humanitarian assistance utilizing climate smart agriculture
- Reduced food insecurity through increased food production and diversification, water resource management and governance, and contribute to security generally through improved livelihood opportunities for women and youth
- Improved productivity in the agriculture sector and livestock industries
- Increased representation of women and youth in food and nutrition activities at community level
