

DISABILITIES INTERGRATION SERVICES AND THERAPIES NETWORK FOR CAPACITY AND TREATMENT

JUNE 2015 – MAY 2019 | IMPLEMENTER: VIETHEALTH

Early disability detection and intervention are known to reduce the rate and degree of disability among children between 0-6 years old. The Disabilities Integration of Services and Therapies Network for Capacity and Treatment project aims to improve the quality of life of children with disabilities under 6 years old and their families by implementing a comprehensive model of early childhood disability detection and intervention (ECDDI) with services, development and education, and integration into society.

PROVIDES EARLY DETECTION AND INTERVENTION SERVICES

The project implements the ECDDI model among children 0-6 years old in Thai Binh province. Screenings and assessments detect barriers to learning, development, and participation, which is essential for later interventions to succeed. Early childhood intervention programs support young children who have been identified as having disabilities with a range of services and support to ensure and enhance children's personal development and resilience, strengthen family capacity and promote the social inclusion of families and children. These services include community-based medical, rehabilitation, special education and referral for professional treatments and interventions.

STRENGTHENS EARLY DETECTION AND INTERVENTION CAPACITY

The project trains key personnel from health, education and social affairs sectors in use of screening tools, disability assessments, special education, rehabilitation and case management. In addition, family members learn to provide home-based education and rehabilitation for their own children. Increasing the capacity of these key groups will allow for sustained support for children with disabilities.

EXPECTED RESULTS

By 2019, the project will enable more than 4,000 doctors, technicians, health workers, kindergarten teachers and parents of children with disabilities to implement the ECDDI model. Over 140,000 children will be screened for disabilities. It is estimated that over 7,000 children with disabilities will be evaluated and classified. Approximately 1,000 children with mild and severe mental disabilities will receive intervention and about 400 children will be referred to specialized centers for early intervention and surgery. The project aims to develop a sustainable ECDDI system in Thai Binh, enhance community awareness on disability and ECDDI and gain support from policymakers to establish ECDDI activities in other locations.
